## GENERAL

## INTRODUCTION

## SCOPE OF THIS MANUAL

This manual is intended for use by experienced technicians familiar with similar types of commercial grade communications equipment. It contains all required service information for the equipment and is current as of this publication date. Changes which may occur after publication are covered by either Service Bulletins or Manual Revisions, which are issued as required.

## ORDERING REPLACEMENT PARTS

When ordering replacement parts or equipment information, the full part identification number should be included. This applies to all parts : components, kits, and chassis. If the part number is not known, include the chassis or kit number of which it is a part and a sufficient description of the required component, for proper identification.

## PERSONNEL SAFETY

The following precautions are recommended for personnel safety :

- DO NOT transmit until all RF connectors are secure and any open connectors are properly terminated.
- SHUT OFF this equipment when near electrical blasting caps or while in an explosive atmosphere.
- This equipment should be serviced by only qualified technicians.

## SERVICE

This radio is designed for easy servicing. Refer to the schematic diagrams, printed circuit board views, and alignment procedures contained within.

## REALIGNMENT

### 1. Getting Acquainted

- ① PTT (Push to Talk) switch  
Press and hold, then speak into the microphone to transmit.
- ② MENU key  
Press to perform various functions. Press and hold while switching the power ON to enter Setting Mode.
- ③ CAL key  
Press before making a call, to alert the other party members.
- ④  $\Delta/\nabla$  keys  
Press to change the operating channel, to select a menu in Setting Mode, and to perform other functions.
- ⑤ Power switch/Volume control  
Turn clockwise to switch the power ON and counter-clockwise to switch the power OFF. Rotate to adjust the volume.
- ⑥ MON key  
Press to monitor the current channel for activity.
- ⑦ LED indicator  
Indicates the transceiver status.
- ⑧ SP/MIC jacks  
Lift the covers and insert the accessory's plugs here.

## REALIGNMENT

### 2. PC Mode

#### 2-1. Preface

The transceiver is programmed by using a personal computer, programming interface (KPG-22) and programming software (KPG-75D).

The programming software can be used with an IBM PC or compatible. Figure 1 shows the setup of an IBM PC for programming.

#### 2-2. Connection Procedure

1. Connect the TK-3130/3131 to the personal computer with the interface cable.
2. When data transmitting from transceiver the red LED goes on. When data receiving to transceiver the green LED goes on.

#### Notes :

- The data stored in the personal computer must match Model Name when it is written into EEPROM.
- Do not press the [PTT] key during data transmission or reception.

#### 2-3. KPG-22 Description

##### (PC programming interface cable : Option)

The KPG-22 is required to interface the TK-3130/3131 to the computer. It has a circuit in its D-subconnector (25-pin) case that converts the RS-232C logic level to the TTL level. The KPG-22 connects the side panel jacks of the TK-3130/3131 to the computers RS-232C serial port.

#### 2-4. Programming Software Description

The KPG-75D Programming Disk is supplied in 3-1/2" disk format. The Software on this disk allows a user to program TK-3130/3131 radios via Programming interface cable (KPG-22).

#### 2-5. Programming with IBM PC

If data is transferred to the transceiver from an IBM PC with the KPG-75D, the data for each set can be modified.

Data can be programmed into the EEPROM in RS-232C format via the SP/MIC jack.

In this mode the PTT line operate as TXD and RXD data lines respectively.

## Receiver System

### ■ Front End

The high-frequency signal from the antenna passes through a low-pass filter and a high-frequency switch (D12, L25 and D13) which switches between transmission and reception, and goes to the BPF (L42) to remove unwanted signals. The resulting signal is amplified by high-frequency amplifier (Q18) and goes to the first mixer (Q19).

### ■ First Mixer

The signal that reaches Q19 is mixed with the first local signal from the VCO to produce a first IF signal (38.85MHz).  
 (Receive frequency – First local frequency  
 = First IF frequency = 38.85MHz)

The first IF signal passes through MCF: XF1 (monolithic crystal filter) to remove unwanted signals.

The first IF signal is amplified by IF amplifier (Q20) and goes to IF IC (IC2).

## CIRCUIT DESCRIPTION

## ■ IF Amplifier

The IF circuit is integrated in the FM IC (IC2). The IF IC contains local input, mixer, limiter amplifier, FM DET, and low-frequency amplifier.

The IF signal coming from the IF amplifier (Q20) goes to the IF IC mixer and is mixed with the second local signal (38.4MHz) to produce a second IF signal. ( $38.85\text{MHz} - 38.4\text{MHz} = 450\text{kHz}$ )

The tripled PLL reference oscillation ( $12.8\text{MHz} \times 3$ ) is used for the second local signal.

The second IF signal passes through ceramic filter (CF1) to remove unwanted signals.

The second IF signal passing through the ceramic filter passes through the limiter amplifier consisting six differential amplifiers and is detected.

The FM detection is quadrature detection method. The phase of the output signal from the limiter amplifier is shifted by 90 degrees by a quad coil (L36) and compared with the original waveform to produce detection output.

## ■ Squelch Circuit

A squelch circuit is provided to prevent no-signal noise or weak signals from outputting to a speaker during transmission.

## ■ AF Circuit

The FM IC output passes through the base band IC (IC205), mute (Q213), and amplifier (IC207). After go to AF power amplifier IC (IC208). This IC have BTL amplifier function and electrical Volume. At internal speaker, BTL amplified. At external speaker, IC switch off the 1 channel amplifier by connectors information.

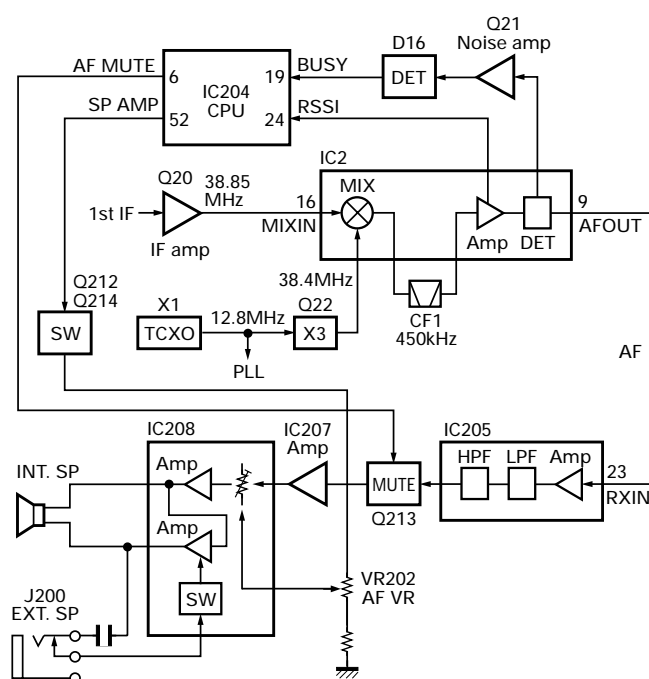

Fig. 4 IF amplifier, squelch and AF amplifier circuits

## Transmitter System

## ■ Microphone Amplifier Circuit

The audio signal from the microphone passes through the MIC amplifier (IC207). Then, the signal goes through the base band IC (IC205) that has the 6dB/oct pre-emphasis circuit, band-pass filter (300 to 3kHz), amplifier, and limiter. The distortion components outside the audio band are removed by the splatter filter.

## ■ Modulation Circuit

The MIC amplifier (IC207) output passes through VR201 for modulation adjustment and goes to the modulation input of the VCO circuit for variable reactance phase modulation.

## ■ Transmission Output Circuit

The VCO output is amplified by a high-frequency amplifier (Q7~Q10), passes through a high-frequency antenna switch, passes through a low-pass filter and goes to the antenna.

The transmission output is about 1W with 3.8V DC supply at battery terminal.

## ■ Low-Pass Filter Circuit

A three-stage Chebyshev type low-pass filter is located between the antenna and transmit/receive switching circuit. It removes harmonic components contained in the transmission output.

## CIRCUIT DESCRIPTION

### PLL System

#### ■ VCO Circuit

The VCO is housed in a shield case.

The VCO circuit consists of a transistor (Q4), a variable capacity diode (D4) for frequency control, a variable capacity diode (D8) for modulation, transmit/receive frequency shift diode (D17), control transistor (Q2), variable capacitor (TC1) for PLL lock voltage control, and oscillator buffer amplifier (Q5).

In receive mode, the shift signal T/R goes low, Q2 turns off, and the shift diode (D17) not contact. Q4 produces the first local frequency for reception.

(Receive channel frequency – 38.85MHz)

In transmit mode, the shift signal T/R goes high, Q2 turns on and D17 does conducts. Q4 produces about 460~470 MHz and the VCO frequency equals the transmit channel frequency.

The 3.0V circuit voltage is produced by ripple removing filter circuit Q3.

Fig. 7 VCO circuit

#### ■ PLL Circuit

Frequency data is sent to the PLL IC (IC1) from the CPU (IC204) as serial data when the power turns on, when the channel is changed, or when transmission begins. It sets the variable divider in the PLL IC.

The TCXO (X1) produce a 12.8MHz reference frequency. It is divided to produce a 12.5kHz PLL comparison frequency in the PLL IC.

The VCO input is divided by the divide ratio set by the divider in the PLL IC to generate 12.5kHz. It is compared with the reference comparison frequency by the phase comparator to detect a phase difference.

The charge pump circuit in the PLL IC converts it to a control voltage that can drive the VCO directly.

The control voltage passes through a loop filter which passes low frequency and is applied to the VCO control pin to control the oscillator frequency. The loop filter removes unwanted harmonics and noise contained in the output from the phase comparator and determines PLL response and synchronizing characteristics by the amplitude and phase characteristics (Fig. 8).

#### ■ Unlock Detection Circuit

If the PLL cannot be synchronized for some reason or other when switching the channel or changing between transmission and reception, the PLL IC outputs a low unlock detection signal. This signal goes to the CPU to inhibit transmission when the PLL is unlocked.

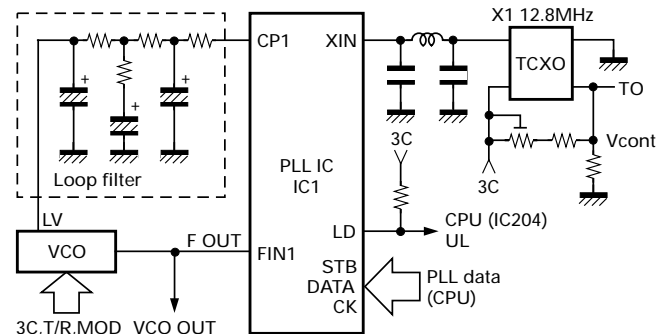

Fig. 8 PLL circuit

## CIRCUIT DESCRIPTION

### Control System

#### ■ Reset Circuit

When a battery voltage is dropped, IC201 is detected low voltage, and this detected signal input to IC204 for stop the CPU function. IC200 is detected the reset voltage.

#### ■ Battery Voltage Detection Circuit

The unit detects a low battery voltage and display the BATT indicator on the LCD. The battery voltage is divided and applied to the analog value input pin (BATT) of the CPU, and converted to a digital signal.

#### ■ Power Supply Circuit

The power supply voltage is maintained to 3.0V by the series regulator (IC213). It is used as CPU power 3M. The 3C, 3R and 3T voltages are regulated by the IC209.

The B (battery voltage) is supplied to the RF final transistor Q10.

The transmission power 3T is supplied to the transmission output circuit when the CPU turns Q219 on only in transmit mode. 3T is junction to VR2 to generate PA gate (Q10) for power alignment.

The reception power 3R is provided to the receive and IF circuits when the CPU turns Q220 on only in receive mode.

The transmission/reception power 3C is supplied to the VCO and PLL circuits when the CPU turns Q218 on in transmit and receive modes.

If no signal is received for 10 seconds, the CPU enters the power save mode, and turns common power 3C and reception power 3R on for one cycle and off for three cycles according to the signals from the CPU to save the battery power.

### ■ QT/DQT

#### • Encode (Transmit)

QT/DQT signal is generated by CPU (IC204). Output signal (IC204 pin 40 (TO)) goes to TCXO modulation and VCO modulation (Through the VR200).

#### • Decode (Receive)

Detected AF signal go to IC206. Function of IC206 is LPF for sub-audible frequency. This signal goes to IC204 pin 20 (TI). IC204 is detected the QT or DQT.

## EXPLODED VIEW

## PACKING (TK-3130/3131 K)

## PACKING (TK-3131 A)

## ADJUSTMENT

### Required Test Equipment

#### 1. Stabilized Power Supply

- 1) The supply voltage can be changed between 0V and 10V, and the current is 3A or more
- 2) The standard voltage is 3.8V

#### 2. DC Ammeter

- 1) Class 1 ammeter (17 ranges and other features).
- 2) The full scale can be set to either 300mA or 3A.
- 3) A cable of less internal loss must be used.

#### 3. Frequency Counter (f. counter)

- 1) Frequencies of up to 1GHz or so can be measured.
- 2) The sensitivity can be changed to 500MHz or below, and measurements are highly stable and accurate (0.2ppm or so).

#### 4. Power Meter

- 1) Measurable frequency : Up to 600MHz
- 2) Impedance :  $50\Omega$ , unbalanced
- 3) Measuring range : Full scale of 3W or so
- 4) A standard cable (5D2W 1m) must be used.

#### 5. RF Voltmeter (RF V.M)

- 1) Measurable frequency : Up to 600MHz or so

#### 6. Linear Detector

- 1) Measurable frequency : Up to 600MHz or so
- 2) Characteristics are flat, and CN is 60dB or more

#### 7. Digital Voltmeter

- 1) Voltage range : FS=10V or so
- 2) Input resistance :  $1M\Omega$  or more

#### 8. Oscilloscope

- 1) Measuring range : DC to 30MHz
- 2) Provides highly accurate measurements for 5 to 25MHz.

#### 9. AF Voltmeter (AF V.M)

- 1) Measurable frequency : 50Hz to 1MHz
- 2) Maximum sensitivity : 1mV or more

#### 10. Standard Signal Generator (SSG)

- 1) Maximum frequency : 600MHz or more
- 2) Output :  $-133\text{dBm}/0.05\mu\text{V}$  to  $7\text{dBm}/501\text{mV}$
- 3) Output impedance :  $50\Omega$

#### 11. Dummy Load

- 1)  $8\Omega$ , 1W or more

#### 12. AF Generator (AG)

- 1) Frequency range : 100Hz to 100kHz
- 2) Output : 0.5mV to 1V

#### 13. Distortion Meter

- 1) Measurable frequency : 30Hz to 100kHz
- 2) Input level : 50mV to 10Vrms

### Switches

- ① PTT (Push to Talk) switch
- ② MENU key
- ③ CAL key
- ④  $\Delta/\nabla$  keys
- ⑤ Power switch/Volume control
- ⑥ MON key
- ⑦ LED indicator
- ⑧ SP/MIC jacks

### Adjustment Frequency List

CH	TX frequency (MHz)	RX frequency (MHz)
Center	465.050	
Low	460.050	
High	469.950	

When you set up above frequencies, you must use the TEST mode in the FPU.

## ADJUSTMENT

### Jigs

Use jigs for repair or adjustment.

#### ■ Extension cable (E30-3480-08)

### Connecting Jigs

Connect the extension cable as shown in the illustration below.

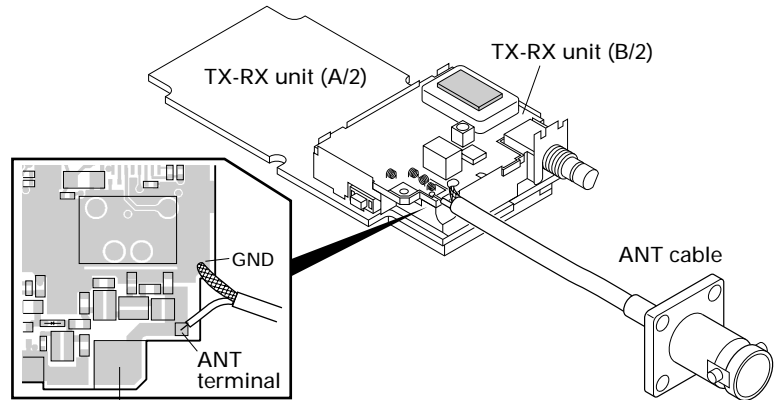

#### ■ ANT cable (E30-3418-05)

Modify the cable as shown below.

Solder the ANT cable to the ANT terminal on the TX-RX unit (B/2).

### Adjustment Points

VR1 : Transmit frequency  
 VR2 : Power (High)  
 TC1 : VCO lock voltage  
 L36 : AF level  
 LV : VCO lock voltage terminal

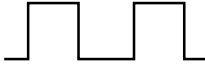

VR200 : DQT/QT balance  
 VR201 : MAX deviation (Wide)  
 +, - : External power supply terminal (Fasten it with an alligator clip.)

## Receiver Section

SG output level for obtaining 12dB/SINAD when injected to each point through a 470pF coupling capacitor.

Modulate the AF level with a frequency of 1kHz and deviation of 1.5kHz (Narrow), 3kHz (Wide). Then take the signal from the signal generator output when set to -53dBm and obtain the level shown on an AF VTVM when the AF output has been adjusted to 0.63Vrms with the AF vol.

## Transmitter Section

AG is set to the MIC input becomes 3.0kHz DEV. at 1kHz. To make measurements in the AF section, connect the AC level meter. In the RF section, use a 1000pF coupling capacitor.
